Smarter technology for a Smarter Planet:

Building a fluid enterprise.

To date, companies have spent billions of dollars building automated systems to manage vertical business functions—ERP, SCM, CRM, etc. Unfortunately, the majority of these systems were never designed to talk to each other. It's no wonder then that the average employee wastes 5.3 hours per week working within these siloed and inefficient processes. It's imperative that businesses find smarter ways to work.

IBM's comprehensive business process management solutions integrate the different pieces of your business, enabling fluid workflows. IBM has given over 5,000 companies the visibility and automated processes they need to optimize performance—from a global freight company that reduced development costs by 30% to an oil producer that is measuring their oil fields in real time, doubling the industry's average recovery rates.

A smarter business needs smarter software, systems and services.
Let's build a smarter planet. ibm.com/flexible

RESPONSES TO:

Microsoft's Reputation, Future Riding on Windows 7

Oct. 22, 2009

As much time and money as Vista has cost me, Microsoft should be giving Windows 7 away.

■ Submitted by: Jim

Windows 7 is warmed-over Vista with even more eye candy. And the prices they're charging for this service pack are just way out of line.

■ Submitted by: Anonymous

It's not a bad OS, as far as stability and performance go. However, the global consumer PC industry itself will be largely sidelined in a few years. Other devices, particularly smartphones, are going to shrink the PC market by making owning a PC optional for using the Internet. This will be especially true in the developing world, which is the market that has been driving PC market growth. The billions who live there may skip owning a PC altogether.

■ Submitted by: Eldon

My copy of Windows 7 Ultimate is arriving today and I look forward to it. I've been using Vista Ultimate x64 since February 2007 on a custom rig that I built well above the minimum specs for Vista. That rig has been rock-solid for almost three years. I run Visual Studio, Adobe CS4, Expression, Studio, Office 2007, etc., and the computer serves as a mission-critical development rig for my business. Nothing I've ever thrown at Vista has ever made it crash or even hiccup.

■ Submitted by: NeuroWin7

Windows 7 is awesome. I have been using this OS since the beta version. I am currently using the RCI release and am very pleased with the performance. If you decide to go with this OS, do not perform an upgrade; do a clean install. Back up all of your data first, then do the install and perform a restore using the Windows 7 backup/restore tool. This tool is the most complete/robust backup app I have ever used. It works great.

VIRTUAL WORLDS

Employee Avatars Will Need Dress Codes

MANAGERS DON'T want an employee showing up at a company function on Second Life as a green spiky animal or wearing barely-there club attire. So analysts at Gartner Inc. recently recommended that as more companies conduct business in virtual worlds, employers should establish ground rules regarding employee avatars.

Gartner predicted that by the end of 2013, 70% of companies will have set behavior guidelines and dress codes for employees who use the remotely controlled online characters in business settings.

"We advise establishing codes of behavior that apply in any circumstance when an employee is acting as a company representative, whether in a real or virtual environment," Gartner analyst James Lundy said in a statement. For example,

whatever rules apply to Web activities such as blogging can be extended to cover virtual worlds, except that visual environments also require a dress code.

To avoid problems with employees mixing their personal and professional virtual lives, companies should suggest that employees use one avatar for work interactions and a different one for personal activities, Gartner said.

Amanda Van Nuys, head of enterprise marketing at Linden Lab, which operates Second Life, agreed about the need for separate work and personal avatars.

"If virtual work is to be taken seriously, then our avatars need to look — and act — as professional as we do in a physical workplace," she said in a blog post.

SECURITY MONITOR

Microsoft Patch Tally: 6 Years, 745 Vulnerabilities

With its massive security update last month, Microsoft Corp. marked the end of the sixth year since it moved to a monthly patch schedule. An informal count of releases in Microsoft's bulletin archives shows that the company has released about 400 security bulletins since October 2003.

The bulletins have addressed about 745 vulnerabilities across almost every Microsoft product. More than half of the bulletins (230) have addressed vulnerabilities that Microsoft called "critical," meaning they would allow attackers to take full administrative control of a system from a remote location.

The total number of flaws disclosed and patched by the software maker so far this year stands at about 160; Microsoft reported 155 for all of 2008. The tally for the past two years is more than double the number of flaws disclosed in 2004 and 2005, the first two full years of Patch Tuesdays.

The last time Microsoft didn't have any patches on a Patch Tuesday was March 2007. In the past six years, Microsoft has had just four

patch-free months — two of which were in 2005.

In contrast, the company issued patches for 10 or more vulnerabilities on more than 20 occasions and patches for 20 or more flaws in a single month on about 10 occasions.

EDUCATION

Laid-off IT Pros Head to the Classroom

A GOVERNMENT GRANT is helping 30 unemployed IT professionals in Georgia start new careers as high school computer science teachers.

With a \$2.5 million grant from the National Science Foundation, the Georgia Institute of Technology's College of Computing has launched "Operation Reboot." The program pairs a laid-off IT professional with an existing high school teacher for at least one year, "allowing the IT professional to learn the ins and outs of a classroom, and the teacher to get an education in IT," the college said in a statement.

The IT professionals will receive an initial teaching certificate with a computer science "endorsement," an add-on that signifies special expertise.

"Through the teacher workshops at Georgia Tech, courses needed for certification, co-teaching and mentoring, we will transform these IT workers' identity into that of a computing teacher,"

said Barbara Ericson, director of the program, in the statement.

In essence, the IT pros get to team-teach with a business teacher who wants to learn how to be a computing teacher, according to a blog post by Mark Guzdial, a Georgia Tech professor and a researcher in computing education. "Both team teachers want to become computing teachers: One knows IT and wants to learn how to be a teacher, and the other is a teacher who wants to learn IT. The result isn't just 30 new high school CS teachers. It's 60 well-trained teachers," he wrote.

The program's broader goal is to improve high school computer science education over the next three years by increasing the number of classes, improving training and creating highly engaging curricular materials.

Georgia Tech will publish the results of the pilot project and share materials with other states.

Facebook has

30,000

servers and 230 staff
engineers supporting
300 million users.

ONLINE COMMUNITY

Businesses Still Back Social Nets

Despite tight budgets, companies are continuing to support the social networking activities they've recently established. In a Deloitte LLP survey of 400 companies, 94% of the respondents said that they plan to maintain or increase their investments in social media tools and online communities, while only 6% said they plan to decrease such investments.

Businesses use metrics such as the number of active users and how many people post or comment to gauge the success of their social networking efforts. But Deloitte said they should consider other measures, too, such as increases in search engine rankings and referral links on other Web sites.

The study found that as social media efforts mature, companies are turning their attention to "lurkers" — people who observe a community but don't participate. Twenty percent of the respondents said that their companies have set up formal "ambassador" programs, which give lurkers special treatment to encourage them to become more active.

FUTURE WATCH

These bees don't sting: A team of computer scientists, engineers and biologists at Harvard University received a \$10 million National Science Foundation grant to fund the development of small, mobile robotic devices dubbed RoboBees. Inspired

by the biology of a bee and the insect's hive behavior, the researchers hope that their work on the RoboBees will lead to advances in the design of miniature robots, compact high-energy power sources, and smart sensors akin to bees' eyes and antennae. The researchers also plan to develop software and communications methods for coordinating a colony of RoboBees, simulating the way real bees rely upon one another to scout, forage and plan.

LETTER FROM AFRICA

Blackouts Hurt Africa's Tech Progress

Power outages, caused in part by receding water in hydroelectric dams, are threatening to derail Africa's technological progress.

South Africa, Namibia, Angola, Zambia, Kenya, Uganda, Tanzania, Nigeria, Ghana and countries within the Sahara desert all suffer from power shortages because demand outstrips supply.

In South Africa, last year's power rationing program, called "load shedding," raised serious concerns as data centers, business process outsourcing facilities and other technology installations suffered from hours of downtime.

This year, Kenya, Uganda and Tanzania have introduced electricity rationing that results in industrial areas losing power intermittently for a day or a few hours at a time and residential areas losing power for up to three days in a week.

"The situation in Kenya is very ironic. I have a friend [offering technical services locally and abroad] who shifted his offices from Nairobi city center to one of the residential areas; now he is experiencing blackouts for three days in a week," said Tony Ng'eno, managing director of WinAfrica Technologies Ltd. in Nairobi.

Power problems increase costs for IT providers and users alike by requiring additional sources of power such as generators, said Dobek Pater, a telecommunications analyst at Africa Analysis, in South Africa.

Officials are trying to persuade international companies to set up data centers in the region, yet those facilities require ample power for servers and cooling systems. "Generators can be used, but only for smaller data centers. This means that the development of large data centers is unlikely to take place," added Pater, via e-mail.

Ghana has had power shortages since 2006 "due to a light rainy season that led to an extremely low water level at the Akosombo Dam, Ghana's main source of electricity," said Yaw Owusu, managing director of Gateway Innovations Ltd., an IT and outsourcing services provider in Africa.

Owusu said the government of Ghana has embarked on an ambitious project to build more power stations - in partnership with the private sector - and hopes to export power to the West Africa region by 2012.

IN THE
NEW
NETWORK
IT'S ALL
ABOUT
THE
BRAINS,

NOT
THE
BOX

The challenges raised by the massive increase in networked devices and their escalating bandwidth demands will not be solved by more hardware, but by a radical rethink in the way networks work.

It calls for a whole new philosophy and that's where Junos[®] comes in.

A revolutionary combination of software, silicon and systems architecture. It's how to make the box smarter. And it's only from Juniper Networks.

Junos is more than an operating system. It's the open-standards, integrated and familial approach to network design at the heart of Juniper routers, switches and security devices. It's a game changer because it brings stability to an environment that has been rife with interoperability issues. Because it creates a platform for third-party innovation and development, and because, in concert with the Junos One family of processors, it enables a new network architecture that is simpler and more powerful than anything before it.

The result is open, interoperable software-powered networking that is scalable, secure and automated.

The new network is here.
And it's running Junos.

Microsoft's OS Future Rides on Windows 7

Early users see promise in the energy-saving features and boot-up times of troubled Vista's successor. **By Gregg Keizer and Patrick Thibodeau**

MICROSOFT Corp.'s standing as an operating system developer is on the line with the launch of Windows 7, according to analysts and other experts.

Late last month, the company formally unveiled its next-generation operating system — the first new Windows release since co-founder and longtime CEO Bill Gates departed in 2008.

"There's a reputation issue at stake here," said Michael Silver, an analyst at Gartner Inc. "Apple has been making fun of them, and Microsoft wants to put an end to that."

Preston Gralla, a *Computerworld* contributing editor who has extensively reviewed Windows 7, said that in following the roundly criticized Windows Vista operating system, "Windows 7

will show if [Microsoft] can do operating systems right, or if they've finally lost it."

Microsoft finds itself vulnerable because of its continuing failure to persuade users to upgrade from Windows XP to Vista since the latter's release three years ago.

The older Windows XP is still used by 72% of computer users worldwide, while just 19% are running Vista, according to Net Applications in Aliso Viejo, Calif.

Though Microsoft last week acknowledged that "isolated issues" caused endless reboots among some users trying to upgrade from Vista to Windows 7, initial data from early corporate adopters of Windows 7 indicates that

the new operating system can cut power costs while saving its users significant time by booting up more quickly.

The group policy controls in Windows 7 are already helping IT personnel at Pella Corp. better manage power use, said Jim Thomas, director of IT operations at the Des Moines-based maker of windows and doors, which has distributed Windows 7 to 200 of its 4,000 users. Users can temporarily reset power management controls, "but every time the group policy reapplies, it puts the power setting down that we want to apply," he said.

Thomas conservatively estimated that using Windows 7 will result in about \$20,000 in annual power savings once the software is fully deployed in 2011.

At Automatic Data Processing Inc. in Roseland, N.J., about 300 of the 30,000 users are running the new operating system, said CIO Mike Capone. He said he has seen estimates that the power management capabilities could deliver savings "into the six-figure range" annually once ADP completes its full rollout, which it expects to do within 36 months.

Randy Benz, CIO at St. Louis-based Energizer Holdings Inc., said that a Windows 7 pilot among 40 users found that the operating system boots up some 80% faster than XP, which can take up to five minutes.

Roger Kay, an analyst at Endpoint Technologies Associates Inc. in Wayland, Mass., noted that "Microsoft in this case wanted to underpromise and overdeliver, which is the opposite of what it did with Vista." ■ Freelance writer *Linda Rosenorange* and *Marc Ferrante* of the *IDG News service* contributed to this story.

Swine Flu Emergency Should Put IT on Alert

Many companies likely aren't prepared to function if large numbers of employees are infected. **By Lucas Mearian**

THOUGH the H1N1 flu has been declared a national emergency by President Barack Obama, experts say that many companies remain ill-prepared for its potential consequences, which could include employee absentee rates of 40% or more.

While last month's emergency declaration is targeted mostly at helping health care providers and government agencies bypass regulatory requirements to provide critical care, experts say it should also be a red flag for the IT and business communities.

"Organizations probably

have not allocated enough resources for virtual private networks nor tested VPNs for the fact that 80% of their staff could be working from home," said Al Berman, executive director of DRI International, a training institute that focuses on helping businesses prepare for emergencies. "We ran some tests with companies, and they ran out of TCP/IP addresses in five minutes."

Berman said that many businesses are probably delaying VPN upgrades because of increasing bandwidth costs. For example, he said, DRI recently met with

officials of a large insurance provider and found that it would cost the company \$1 million to boost bandwidth enough to support 40% of its staff working from home.

The federal government's Flu.gov Web site, managed by the U.S. Department of Health and Human Services, offers guidance to businesses about what to do in the event of a pandemic. Its suggestions range from making sure sick employees stay home to appointing a pandemic coordinator or team to oversee the preparation and implementation of a disaster plan.

Employers should "send a very strong message to employees to stay home if they're sick. No one is that essential," said Kim Elliott, deputy director of Trust for America's Health, a public health advocacy group. "You don't want employees com-

ing in and infecting others to the point where your business shuts down."

The pandemic coordinator or team should monitor employees to ensure that they follow basic rules of hygiene, such as washing their hands, and make sure that face masks are available, according to the Flu.gov Web site.

Elliott said that the planning process should also include an assessment of how the absence of a large number of employees would affect operations, with recommendations on how to keep things running under such circumstances.

"That may mean cross-training employees in some key business functions," Elliott said, citing IT infrastructure maintenance, bookkeeping and accounting duties, and some customer-facing activities.

Businesses should also develop a plan to communicate with municipal agencies, which determine whether bus routes, schools or even businesses need to be shut down, Berman said.

The national emergency declaration came after a weekly U.S. Centers for Disease Control and Prevention report called FluView noted that 43 states are now reporting widespread influenza activity and that H1N1 has caused 1,000 deaths in the U.S.

The World Health Organization had declared the H1N1 flu outbreak a pandemic in June, elevating its health emergency alert status to Phase 6 — its highest level. At that time, the number of influenza cases was close to 30,000 worldwide. The WHO now says there are 414,000 confirmed cases of H1N1 and that there have been nearly 5,000 H1N1-related deaths. ■

■ THE GRILL

Gordon Bell

The master researcher wants us to **supplement our memories** by storing bits of our lives **in the cloud.**

One researcher at Microsoft Corp. hopes that someday we'll all be able to easily recall our lives, and not just the major moments like weddings and graduations, but all the little things that fill our days as well.

Gordon Bell, a computer industry pioneer and a principal researcher at Microsoft's research arm, is well into a 10-year archiving project, dubbed MyLifeBits. The 75-year-old IT innovator has been working to supplement his own memories by amassing a database of images, video, e-mails, phone conversations, GPS coordinates and printed documents.

Bell wants to archive vacations, workdays, casual walks, conversations and books he's read — his whole life — and thinks it won't be long before the rest of us do, too. His new book, *Total Recall*, co-authored with Jim Gemmell, tracks the project.

In an interview with Computerworld, Bell talked about storing all of that sensitive data in the cloud, our social networking self-obsession, whether there's information he wishes he hadn't saved, and what devices will help us collect the bits and pieces of our everyday lives.

Dossier

Name: Gordon Bell

Title: Principal researcher

Organization: Microsoft Research Silicon Valley

Locations: San Francisco, and Sydney, Australia

Favorite gadget: "It's perhaps the Bodybugg. It's a health monitoring device. It tells you how much energy you're expending throughout the day. Oh, and the Kindle DX."

Favorite social network: "Actually, I think I prefer much more old-fashioned e-mail. I'm on Facebook, but I don't really use it that much. I've Twittered a few times, but I don't really use it, either."

Guilty pleasure: "A lot of chocolates."

A black and white photograph of a man in a suit and tie, smiling, standing in front of a server rack. The server rack is filled with various components and lights, creating a technical background.

NEC GIVES RMS WHAT IT NEEDS – VIRTUALIZATION FOR REAL RESULTS.

Revenue Management Solutions (RMS) runs one of the largest Microsoft® SQL Server® databases in the world. Their global econometrics consultancy includes some of the world's largest restaurant and retail chains. To handle the tremendous volume of data required to discover profit insights and provide pricing guidance for their clients, they've adopted virtualization solutions from NEC. Says John Oakes, "The reliability of NEC technology lets RMS focus on growing the business." At RMS, virtualization is good business.

NEC

“In the spirit of being a collector, it’s always a feeling of, ‘My God, it’s not complete.’ I haven’t deleted anything. I just don’t believe in it.

Continued from page 18

Were you a collector as a kid? How far back does this go for you? I don’t think I was really a serious collector. One time I went around the neighborhood and collected all the different manufacturers of razor blades just to

see how many there were. Well, that’s pretty weird. I’ve taken about 14 bicycle trips in France, and each one was extensively logged — all the places I stayed. The trip was measured in stars per meal.

What’s your ultimate goal with this project? The goal really was to explore the future and put a vision out there that I think we’ll all be working toward. You’ll have memories that you can pass on from generation to generation, and you pass on as much as you’re willing to. There’s that aspect of being able to have a kind of immortality.

If you’re passing all this information to another generation, do you weed through all the chaff to give them just the good stuff, or do you give it all to them? I’m willing to give them everything. I think this is where you need a lot of tools to deal with all the information. You have to organize things. As my children go through it, they’re not so interested in what I did at work, but they want to recall a trip we all took together. They’ll use it for recalling our memories together.

Has there been any information that you look at now and wish you hadn’t saved? Never. I really have never had that feeling. It’s always the other. I wish I had the whole thing. In the spirit of being a collector, it’s always a feeling of, “My God, it’s not complete.” I haven’t deleted anything. I just don’t believe in it.

Where will all this information be stored? I’m right in that ambivalent state of, Where is all of this going to reside? Maybe there will be a public archive or a way of having all of your life in the cloud. It’s not there for everybody to see, but it’s just there as a placeholder for you. It started out that there would be an appliance, and that would be your memory extension. That idea held for a long time. I still think of an appliance, but I’m not sure how much of that will be backed up in the cloud.

Do you think if everything we do, everything we say, everywhere we go is

recorded, it will make us censor our own actions? Would you want your kids to know you scalped concert tickets or gossiped about a friend? I don’t know about that. I think you kind of forget that it’s happening, that it’s being recorded.

We’re all so self-obsessed these days, posting updates on Facebook and Twitter about the smallest details of our everyday lives. Could this make us even worse? The issue is “lifelogging” as opposed to “lifeblogging.” We’re not advocates of putting that stuff in a public place. People who believe they need to put all of that stuff out in public and make statements in public, we’re very skeptical that you want to do that. I don’t think you gain anything by spilling your guts about your actions.

What about privacy and security issues with all of this information sitting out there? We’re not introducing anything that isn’t already out there. I think it may come down that your electronic memory is not [legally] discoverable. That’s my private memory, and you can’t make me disclose it.

If you plan on storing this on the cloud, doesn’t that raise even more security issues? I don’t think it’s any [less secure]. I think cloud security will be dealt with. The overall security will be improved. Every six months, you see that someone’s PC has been stolen or moved and another million passwords or credit cards have been stolen. Frankly, I think [cloud security] will be better than what we have today, where it’s physically so distributed.

In five, 10 or 20 years, what devices will we have to help us record all these different aspects of our lives? I think virtually a record of your life will be carried in your pocket. Certainly in 20 years, cell phones will have a pretty good memory of what’s going on in your life. With the changes in storage, GPS, and cameras and audio and video, they’re important collectors. And then we’ll have the storage to save everything, whether it’s in the cloud or on your home server.

HP EliteBook and Intel® vPro™ Technology: Rx for Healthcare Mobility

WITH THE SUDDEN INFLUX of new, productivity-enhancing applications, even the most tethered of industries are anxious to go mobile or enhance their current mobile technology. Nowhere is this more evident than in the healthcare industry, which is set to make great strides, thanks to advances such as electronic medical records (EMR) and remote diagnosis applications. However, for IT organizations to fully embrace mobility, they must be assured that the hardware and software supporting these applications are durable, reliable, energy efficient and secure.

HP's EliteBook business notebook portfolio featuring HP Professional Innovations and Intel® vPro™ technology is exactly what the doctor ordered for healthcare and other mobility-seeking environments, according to industry experts. These notebooks have the flexibility, durability, wireless infrastructure and hardware-assisted security and manageability to give IT managers the confidence that users will be able to thrive in this new environment.¹

"Few things are designed from the inside out to be amazing," says Rob Enderle, principal of The Enderle Group, a consulting firm in San Jose, Calif. "If anyone would have told me a year ago that I would find business-class and professional mobile workstations to be the exceptions, I would have laughed in their face. However, the HP EliteBook Mobile Workstations and the HP business-class workstations are amazing products."

In healthcare, clinicians, physicians, nurses and patients all need immediate access to information, such as EMR, from the point of care. They also need the ability to engage in clear, but secure, communications among themselves. Therefore, they require lightweight, high-performance notebooks with extended battery life and built-in security. With these features, they can provide care from patient bedsides, upload lab results, write prescriptions and orders, access schedules, and review important digital images such as X-rays or MRIs without worrying about recharging, privacy breaches and other common obstacles.²

Durability

Hospitals, doctors' offices and other healthcare locations can be hard on mobile devices. HP EliteBooks, with some weighing in at less than 5 pounds, have a DuraCase magnesium design that is business-rugged. Some EliteBooks are equipped with a 4-point lockdown mechanism that allows the notebook to stay aligned even if it sustains a fall.² In addition, the machines are protected from common keyboard mishaps thanks to a thin layer of Mylar film that minimizes the risk to sensitive, critical components, and HP DuraKeys, which makes the keys 50 times more resistant to wear and tear.

A final feature of the HP EliteBook that protects it from damage is the HP 3D DriveGuard, which physically secures the drive if the machine is dropped. HP 3D DriveGuard is an accelerometer on

the drive that parks the heads of the hard drive to protect data during impact.

More Power

In addition to durability, users in healthcare environments also need assurance that they can get through a shift, even while using resource-intensive applications, without having to stop and recharge their notebooks.

HP EliteBook notebooks are energy efficient and have extended battery life. They meet the U.S. government's Energy Star program requirements as well as the Electronic Product Environmental Assessment Tool (EPEAT). Extremely durable solid state drives from Intel, which generate less heat and noise and consume 50% less power than standard hard drives, and default power settings help extend runtime. By combining the solid state drives, energy-efficient Intel® Core™2 Duo processors,³ power management, a state-of-the-art LED display and HP's Ultra Capacity Battery, users can achieve up to 24 hours on a properly

¹ Wireless access point and Internet access required. Availability of public wireless access points limited.

² Test results are not a guarantee of future performance under these test conditions.

configured 6930p with Ultra Capacity Battery.*

Studies have shown that by upgrading from 4-year-old desktop PCs to notebooks with integrated Intel vPro technology, healthcare organizations can reduce energy consumption significantly.

Quick and Secure

While pulling up records from a patient's bedside seems like nirvana compared with older days, it could quickly become frustrating without enhanced speed and security.

HP Professional Innovations also helps ensure that users function in a secure environment without the constant need for IT intervention. For instance, with Spare Key, if users lose or forget their password, they can still access data if they can answer several predetermined questions. This avoids disruption in patient care as users wait for IT to reset their

passwords. They also can use Credential Manager for HP ProtectTools to facilitate safe, single sign-on and guard against unauthorized notebook access.

To assure compliance in safeguarding sensitive information, IT can erase a notebook that is ready to be decommissioned or reassigned using HP Disk Sanitizer, and users can manage their own file deletion using File Sanitizer.³ Also, with Intel vPro technology,⁴ each machine has added protection against viruses and attacks with programmable defense filters.⁵ IT organizations can rely on Intel vPro technology to help ensure enhanced security with faster patch saturation and perform faster, more accurate asset inventories.

With Intel vPro technology, remote configuration, diagnosis, isolation and repair of infected PCs are easier as well, even if the PCs are outside of the corporate firewalls. This reduces the need for IT

to travel to physicians' offices or other off-site locations within the healthcare organization. Finally, to assist with patient privacy, the HP EliteBook has display filters that prevent others from seeing their screens from an angle.

Even though they are easily one of the most demanding environments, healthcare organizations can achieve highly productive mobility with HP EliteBook notebooks. With the superior benefits of HP Professional Innovations and Intel vPro technology built in, the HP EliteBook is an outstanding choice for flexibility, durability, reliability, wireless connectivity, security and manageability.

8. The Intel Secure Desktop Bit feature combined with Microsoft Windows XP Service Pack 2 provides additional protection against buffer overflow attacks similar to Microsoft's "Denial of Service" (Secure Desktop Bit) is only enabled in certain operating systems including the current versions of Microsoft Windows XP and Vista (Sec. Protection of the OS or applications was not be enabled by default. After properly installing the appropriate operating system releases, users must enable the protection of their applications and associated files from buffer overflow attacks. Consult your OS documentation for information on enabling ID. It is strongly recommended that users continue to use Prologics and anti-virus software as part of their security strategy.

Follow the

State IT shops are scrambling to meet federal rules of the \$787 billion economic stimulus package. By

THERE'S no such thing as a free lunch, especially for IT.

Go to the state of Iowa's Web site, and you can see that of the \$2.5 billion in federal economic stimulus money earmarked for the state under the American Recovery

and Reinvestment Act of 2009 (ARRA), \$553 million has already been spent on health, education, infrastructure and other programs designed to create jobs and jump-start the local economy.

Drill a bit deeper into the data and you can pull up the exact amounts spent on weatherization training and

technical programs, rental assistance programs and hundreds of other individual projects.

Iowa CIO John Gillespie figures his IT organization has devoted

about 800 man-hours so far to making that data available to the state's citizenry. "We actually had to build the application to give [different state

“One of the biggest challenges is just the speed at which we had to get things done.”

JOHN GILLESPIE,
CIO, STATE OF IOWA

agencies and programs] a way to submit data to us," he says.

But the far bigger challenge, Gillespie says, has been building the business rules and defining internal processes to comply with federal reporting requirements, which have changed or been updated several times since the stimulus package was first announced in February. States are required to file quarterly reports that fully account for every tax dollar spent.

Just as the \$787 billion ARRA is unprecedented, so are the reporting demands it's making on state CIOs and IT organizations, which are scrambling to whip up new processes and tools to accurately track and account for their

Money

for tracking every penny
Julia King

■ COVER STORY

states' shares of the stimulus pie. The process has been complicated by a variety of factors, including exceedingly tight deadlines and complex and changing federal reporting guidelines.

Another big problem is the lack of a central accounting system in most states, which have had to first devise ways of extracting and aggregating data from multiple systems across hundreds of agencies before rolling it up to report it to the federal government.

Like so many of the energy and construction projects launched with stimulus dollars, tracking and reporting systems remain works in progress.

In Missouri, one of a handful of states to have a central accounting system used across all state agencies, funding and budgeting data is relatively easy to access. What remains difficult to grasp, however, is precisely what the federal government wants to know, says CIO Bill Bryan.

Two data points the feds want to track are job creation and retention under the economic stimulus program. "But the definition and requirements for how to count jobs is quite a challenge to understand," according to Marilyn Gerard-Hartman, director of enterprise applications for Missouri. For example, if the state awards a highway infrastructure project to a contractor who in

The Best Trackers

Maryland
Colorado
Washington
West Virginia
New York
Pennsylvania

turn hires a subcontractor, who in turn hires other subcontractors, "how far down the chain is the state responsible for tracking? And do you only count it as a job created if the job wouldn't have existed without the ARRA funding?"

Generally, "it hasn't been clear what the requirements are until fairly late in the game," adds Bryan.

Meanwhile, fulfilling the requirements to the letter of the federal law is critical, Bryan notes. "If you don't comply, you could get thrown under the bus and not get any further funding."

"One of the biggest challenges is just the speed at which we had to get things done," says Iowa's Gillespie. "The rules

for the most part didn't get finalized literally until weeks — not months — ago. Just keeping up has been the big-gest challenge."

Rather than licensing commercial stimulus-tracking tools, Gillespie's team internally developed a tracking and reporting system "using tools already familiar to financial folks who have all the data in Excel spreadsheets," he explains. The data is imported into a database, where it is aggregated, extracted and converted to an XML-formatted report and submitted online to the federal government.

FIRST THINGS FIRST

But before IT could build the tracking system, "we actually had to build a Web-based application to give people a way to submit data to us," Gillespie explains. All of this was done in a matter of weeks by a small team comprising a designer-architect, a programmer and a project manager who is the chief liaison between IT and the state's stimulus office. The team already had some experience from working on the state's recovery Web site, which Gillespie says has "been kind of an iterative process that has been going on since the first recovery money came out."

He chalks up the speedy rate of progress on both projects to what

Utah Adopts 'Less Is More' ARRA Strategy

Presented with the reporting requirements of the economic stimulus program, Utah CIO Steve Fletcher reveals adding himself, "Do we really want to invest in a lot of gee-whiz software to do this?"

The answer was, and remains, a resounding no. Instead, Fletcher and other Utah officials decided to build on a statewide spending transparency program and Web site already under development. That program, like the state's American Recovery and Reinvestment Act tracking and reporting tools, capitalizes on a centralized accounting system overseen by a centralized IT organization,

which Fletcher says has made all the difference.

Four years ago, all IT services — which were previously located in individual agencies — were brought under a single statewide organization with one CIO. "Now we partner with the agencies to provide IT services," Fletcher says. "We have a single accounting system, a single IT organization, and we understand what the agencies' businesses are. It has helped us a lot to turn on a dime."

Earlier this year, Utah rolled out a state transparency Web site that includes every single transaction made by the state.

"You can search it, download it to a spreadsheet, sort it in different ways — by account code, by organization and by individual," Fletcher says.

Rather than buying and implementing a separate software package for ARRA reporting and creating a separate ARRA Web site, Fletcher's team flagged ARRA-related expenditures in the state's existing central accounting system so they could be tracked and reported out as a separate entity on the state's original Web site.

"We decided not to really go huge on a [sep-

arate ARRA] Web site, but basically to transfer information and integrate it [on the state Web site] so it will be visually useful as well as functionally compliant," Fletcher explains.

There's still one hole: Under a federal requirement, the states also must report ARRA spending of "sub-recipients," like school districts and health care organizations, even when those sub-recipients received the money directly from the federal government.

"One of the problems with the way [some] funding is done is we have no clue about it, because the money doesn't go through the state. But we are still required to report on it," Fletcher says. "Any money that goes into the state has to be reported to the state, even though we have no [direct] knowledge of it."

So, how is the state coping with this requirement? "We have to coordinate with all of those entities the best we can," Fletcher says. "We have to reach out for reporting, and that remains a challenge."

— JULIA KING

ARRA Stimulus Reporting: The Basics

More than two-dozen federal agencies have been allocated a portion of the \$787 billion in stimulus money. Each federal agency develops specific plans for its share, then awards grants and contracts to state governments or, in some cases, directly to schools, hospitals, contractors or other organizations. The federal agencies are required to file weekly financial reports on how they're spending

the money and their specific activities involving ARRA funds.

Last month, states and other grant recipients for the first time filed the quarterly spending reports required under the law.

The executive branch has worked hard to ensure a smooth reporting operation, according to Rob Nabors, director of the federal Office of Management and Budget.

As Nabors puts it: "Between OMB and the vice president's office and others in the White House and out in the agencies, we've done 169 different conference calls with recipients. There've been 170 events with state officials. We've had 37 different events with local government officials. There have been seven White House forums, and there've been 20 separate Recovery Act reporting training sessions. That by itself is an unprecedented effort by the federal government to make sure that we get it right, and this was something that started all the way back in February."

— JULIA KING

he describes as healthy competition among states to have good reporting and great Web sites. "We wanted to be better than everybody else," he says.

But given the fierce push to quickly distribute ARRA funds and get new projects up and running, traditional IT project management practices, such as having a comprehensive set of user requirements, have in some cases gone out the window.

In Missouri, for example, a team was in the midst of implementing Microsoft Corp.'s Stimulus360 software for tracking funding and projects when the feds issued a change in data models for reporting.

"We had to move forward with plans and put things in place even though you knew [more] changes were coming," says Gerard-Hartman.

LIKE A START-UP

At the newly formed Massachusetts Recovery and Reinvestment Office, Deputy Director Ramesh Advani likens the fast pace and deadline-driven atmosphere and culture to the environment of a start-up company.

"When you're doing something for the first time, you deal with systems issues, people issues, deadline issues, and you come across something new every day," he says. Tracking and reporting how many jobs are created with ARRA funds is a prime example. Meeting the first federal reporting deadline of Oct. 10 required some on-the-fly tactics.

"For the first round of reporting, what we have done is develop some manual templates, which we issued out to state agencies. Each agency must use the same template and also pass it on to subrecipients and vendors. That

data will then be gathered and uploaded into a recently launched central database, then uploaded through XML to the federal system," he explains.

But this is only for the first round of reporting, Advani emphasizes. For the long term, the state is developing an automated data-gathering and -analysis system that includes Oracle Corp. business intelligence tools, data marts and data warehousing.

"We're trying not to make this a short-term solution, because ultimately

we want to upgrade how we do grants management and our budgets across the board. We want to make sure we can use the same tools and reporting database beyond ARRA," Advani says.

ARRA's tight timeline and strict reporting deadlines have already driven some key process improvements in the state. For example, funding for ARRA transportation and highway projects had a 120-day "use it or lose it" deadline. But it typically took the state between 100 and 300 days to advertise projects and solicit bids from contractors. "We ended up drilling down into the system to get it down to a 40-day process, which is something we're proud about," Advani says.

Another long-term improvement is the creation of the program office itself. Going forward, the office will oversee all activities involving grants reporting, monitoring and compliance. The goal is to increase overall information transparency "beyond what's expected for federal reporting," says Advani.

Maine CIO Dick Thompson says he's already been directed by a legislative committee to ensure that IT work done to meet ARRA reporting requirements is also used to increase information transparency statewide. Before ARRA, for example, the state didn't provide electronic versions of contracts on its Web site — which is a requirement under ARRA. "Now, we'll take that technology and process new contracts through the same system so we can provide broader information on all contracts that have been awarded," he says.

The result of ARRA reporting, CIOs agree, is a lot like the road signs popping up that say: "Temporary Inconvenience, Permanent Improvement."

The Stimulus Law's Fast-Paced Schedule

The American Recovery and Reinvestment Act is signed into law. The federal government's Recovery.gov Web site goes live.

Federal agencies begin announcing block grant awards.

Agency and program plans are posted on Recovery.gov.

ARRA stimulus money is distributed to states and other recipients.

Reporting requirements and updates are developed and distributed.

Recovery.gov is re-launched with geographic mapping.

The first quarterly deadline for recipient reporting is reached.

Recipient grant and loan data is posted.

MARYLAND:

Leader of the Pack

The state is a pioneer in using Web maps to track government spending and performance. By Robert L. Mitchell

This overview shows where stimulus money is being spent, by county. Users can mouse over specific counties to see dollar amounts. The colored "heat map" background indicates population density.

MARYLAND Gov. Martin O'Malley doesn't have to guess where federal stimulus funds will do the most good in his state: He can see for himself—and his constituents can, too.

The state has literally mapped out where every dollar from the American Recovery and Reinvestment Act (ARRA) is going. The data is displayed at StateStat, a Web site that pulls data from a geographic information system (GIS) that O'Malley's administration originally developed in 2007 to track the performance of state government.

With StateStat in place, "we were well

equipped to track those recovery dollars and do so in an open, transparent and measurable way," O'Malley says.

Maryland's pioneering work with GIS and ARRA reporting caught the eye of Earl Devaney, who, as chairman of the Recovery Accountability and Transparency Board, pushed for GIS-based reporting on the federal government's new Recovery.gov Web site.

That site, which relaunched on Sept. 28, uses similar technology to add spending maps. "This is one of the most important features on the whole Web site," says spokesman Edward Pound.

Visitors to Maryland's StateStat Web site can see the total amount of stimu-

lus dollars coming into the state and the counties that are receiving those funds. Projects show up on maps as pushpin-style icons that vary in size with the spending within each area.

Building on templates originally developed for Maryland by GIS vendor Environmental Systems Research Institute Inc. (ESRI), some other states have begun using the same tools to build their own reporting Web sites.

RANKED NO. 1

What makes Maryland unique is the breadth and depth of data it provides, says Phil Mattera, research director at Good Jobs First, a Washington-based nonprofit research center that has ranked state Web sites based on how well they disclose expenditures from the \$787 billion stimulus bill. Maryland is ranked No. 1.

At StateStat, visitors can view spending within specific categories, such as transportation and housing. From there, they can drill down to see the exact locations and details of specific programs and projects. In some areas, such as transportation, they can see who got the contracts, the winning bid, how far along the project is and the number of jobs each project will create. "Maryland is one of the few that has been doing that," says Mattera.

What's particularly powerful about StateStat is its potential to show visually whether spending matches up with the areas of greatest need. Visitors can view maps with overlays that show both spending data and need levels for every area. The need overlays might include regional unemployment

or foreclosure rates, for example. "The maps show us where the problems are and therefore where the opportunities are," O'Malley says. Most states aren't doing that yet, Mattera notes.

BALTIMORE ROOTS

StateStat, which the O'Malley administration launched shortly after taking office in 2007, is based on a system called CitiStat, whose development O'Malley oversaw when he was mayor of Baltimore. CitiStat was based on CompStat, a statistical reporting system used in New York in the late '90s to fight crime.

StateStat is built on ESRI's ArcGIS server platform. It uses Web services developed by the state as well as the StateStat templates that ESRI built in collaboration with Maryland and other states. ESRI has made those templates available at no charge to any state that wants to use them.

Since many state governments already use ESRI's GIS products, the incremental cost to implement the system is relatively small, says ESRI founder and President Jack Dangermond. Other states, such as Washington and Colorado, have used the templates to build their own reporting sites.

StateStat has the potential to show citizens the return on investment they get from government programs, and it could be used to hold agency chiefs accountable, O'Malley says.

During biweekly meetings with department heads, the governor uses GIS maps to track projects and the performance of departments. O'Malley says he uses GIS maps to quickly assess which divisions are performing well and which need new leadership. "That ability to recognize who the leaders are is what gets your entire organization to lean forward. That's what makes it go," he says.

But StateStat is far from perfect. "There's a lot of missing data," says Mattera, especially with regard to specific project details and performance metrics that show the impact of programs, such as the effect of weatherization initiatives on the number of applications for energy assistance.

"The data in there now is not as granular as we want it," says Beth Blauer, director of the StateStat program. But that's just one item on her wish list.

"We are still dealing with a lot of is-

During biweekly meetings with department heads, Maryland GIS maps to track projects and departmental performance.

uses as they relate to getting the data into iMap," the ArcGIS server behind StateStat, says Blauer. Those issues include data ownership, accuracy, age, how often data is refreshed and whether it will be meaningful to decision-makers.

Because the state agencies use many different GIS servers and databases, they export data in Excel format and give it to Blauer's staff, who must import it manually. It has been particularly difficult to maintain data integrity and get updates automated, she says.

The maps show us where the problems are and therefore where the opportunities are.

MARTIN O'MALLEY,
GOVERNOR, STATE OF MARYLAND

Another goal is to add performance data that could, for example, illustrate the impact of a program by showing the effect of spending on the unemployment rate.

Blauer says that eventually, StateStat will be used at all levels of government and available to the public. "You'll be able to see where we are spending money in education and whether the test scores are getting better."

She also envisions adding tools to allow public participation online. "They will be able to engage in a dialogue with government using the data," she says. But that may take some time: Blauer has just five people on staff.

While the state of Maryland is using mapping technology to show where

federal stimulus money is being spent, ironically, it has yet to do the same for the expenditure of funds from its own state coffers. Most information is still viewed by department, not by the geographic area where the money is actually spent. But O'Malley says he wants to move in that direction.

He also says he wants to make the raw data behind all of those pretty maps and charts available to the public as a download that could be imported into Excel, a GIS application or other analytical tools for further analysis (a feature that Recovery.gov already offers for all stimulus spending data — including Maryland's).

However, releasing the raw data behind all state government reporting means the administration will lose control of how results are presented. In the worst-case scenario, the data could be misused or misinterpreted.

But O'Malley says he isn't worried. "I gamble wholly on the notion that people are smart and that, if given the information, [they] will make increasingly better decisions," he says.

Whether StateStat ushers in a new era of openness in government — or fades with the ARRA reporting requirements — will likely depend more on politics than on technology.

But O'Malley is optimistic. He points to his successor in Baltimore, who has continued to use CitiStat. "The public saw the value in it. That would have made it difficult to not continue doing it," he says. "Hopefully my successor here will also continue to do that [with StateStat]."

World of Warcraft In the Workplace

COMPUTER GAMES are good, right? They're stimulating, challenging and fun. Just keep them out of the workplace.

That's what we've always been told, even though "stimulating, challenging and fun" are things the work environment always needs. Most corporations banned games

ages ago. Unfortunately, that means they're missing out on an important way to transmit information.

Organizations got rid of games because they were distractions that wasted time, used too much computing power and created security holes. But there are compelling reasons for corporations to reconsider and maybe even create games for their employees to use (yes, at work!).

Games can teach and reinforce specialized skills. Moreover, they allow players to acquire and practice those skills without damaging expensive equipment or putting anyone in danger. According to a study at New York's Beth Israel Medical Center, surgeons who performed laparoscopic surgery were faster and more accurate if they had played video games extensively when they were younger. Today, some surgeons play

video games as a warm-up exercise to improve fine motor coordination before performing laparoscopic surgery. The military uses war games to train soldiers for combat and uses simulators to help foot soldiers distinguish between combatants and noncombatants in urban settings. Commercial and military pilots receive much of their initial training in simulators.

Games can be used to anticipate and shape the future. Jane McGonigal created a massively multiplayer forecasting game, *Superstruct*, for the Institute for the Future (IFF). The game invited players to propose solutions to possible global challenges, including massive energy

shortages, terrorists with biological weapons, global food supply contamination, and large numbers of refugees fleeing economic and natural disasters. Superstruct players rewarded one another with points based on things like creativity, persuasiveness and cooperation. They came up with many creative solutions during the game's six-week life span, and many of the ideas were incorporated into the IFF's 2009 Ten-Year Forecast.

Games can also help get consumers interested in products without making them feel as if they are getting a sales pitch. Disney released a free iPhone game, *RhinoBall*, to promote the movie *Bolt*. And Honda developed an online racing game to promote its cars.

Back in the world of health care, the fifth annual Games for Health Conference focused on games

promoting mental agility and wellness. The Robert Wood Johnson Foundation sponsors the Health Games Research program, which awards grants for developing interactive games that increase physical activity (such as dance pads) and improve self-care.

Effective games utilize many of the principles that made *World of Warcraft* so successful. Players participate in quests composed of challenging tasks that are satisfying to accomplish and are linked to a clear mission. Real-time feedback reflects players' progress.

These underlying principles can easily be applied in business. For example, games can help build a sense of community across a department or among a geographically dispersed workforce. Game interfaces can be adopted to provide feedback and promote healthy competition. Imagine gauges similar to those in *World of Warcraft* appearing on every customer service rep's screen.

Well-designed games can motivate workers and provide useful services to customers. Get ideas from the gamers in your organization. Someday gaming expertise may even become part of employees' annual performance goals. Wanna play? ■

DATA CENTER ■

TOM GONZALES is planning to shrink his company's data center footprint from 45-by-

15 feet to a mere 12-by-12 feet — and he couldn't be happier. "We're using more space than we need," he says. "We're going to return some of that to the company."

Gonzales, senior network administrator at Denver-based Credit Union of Colorado, says smaller is better when it comes to data centers — now more than ever, given the tight economy. "It's time to do more with less," he says.

Percentage of IT managers at large companies who say that in the next few years they will "keep the same number of data centers but consolidate them so they occupy less space."

The Incredible Shrinking Data Center

Other IT managers are repeating that mantra, helping their companies cope with hard times by making their data centers smaller and more compact. IT managers have gotten to these more-productive footprints by using virtualization, high-density and multifunction hardware, alternative energy sources and modular design techniques. The savings accrue from decreases in energy bills, property costs and maintenance expenditures.

At the credit union, for example, server virtualization helped lower data center space requirements while making IT leaner and more efficient. "We used to have

The data center is a place where the computer world meets the real world. It's a place where the computer world meets the real world.

It's a place where the computer world meets the real world. It's a place where the computer world meets the real world.

Gonzales, senior data center administrator at Deutsche Credit Union, of course, says smaller is better when it comes to data centers—now more than ever, given the right economy. "It's time to do more with less," he says.

SHRINKAGE AHEAD

■ DATA CENTER

40 boxes, now we're down to just a couple and a lot of virtualization. We have 12 racks right now, and we're going to consolidate that down to just four," Gonzales says.

The steady consolidation of servers and related resources over the past few years has left the credit union's old data center with plenty of excess room. "We've been trying to talk them into giving us a foosball table or a pool table in there because there's more than enough empty floor space," he jokes.

Actually, the freed-up space will be put to good use by the 80,000-member credit union. "We're in downtown Denver in our own building, but real estate here is expensive," Gonzales says. "We're trying to give some of our space to departments that [provide] member-facing services."

MORE THAN SIZE

Yet data center size shouldn't be the sole focus of cost-saving initiatives, warns Steve Sams, vice president of site and facilities services at IBM Global Technology Services. "The physical footprint is not where the cost of the data center is," he says. "The physical footprint typically represents, in traditional data center builds, 7% to 10% of the cost."

If space-conscious managers focus on systems and the accompanying support infrastructure, a footprint reduction will be the logical outcome, Sams says. About 60% of a data center's cost is from the power and cooling infrastructure — the air conditioning systems, the chillers, the generators, the uninterruptible power supplies, the power distribution units and so on, he says.

Five Ways to Get Small

Analysts and IT managers offer the following advice:

1 Adopt virtualization. With virtualization, you can make more efficient use of your physical servers, reducing the hardware needed.

2 Use space-saving hardware. When shopping for servers, storage devices and other hardware, evaluate their shape and size and consider how the products will fit into your data center. If starting from scratch, consider designing a scalable, modular data center.

3 Look for devices that can handle two or more jobs. Use a combination

firewall/router, for example, rather than single-purpose appliances.

4 Keep it simple. Limit the number of cables and fixtures you use, and consolidate any other gear you can.

5 Don't leave extra hardware lying around. Sell, give away or recycle unneeded equipment. If you think you might need to use a certain item in the future, perhaps as an emergency substitute, place it in an easily accessible storage area where it won't consume prime data center space.

— JOHN EDWARDS

For the credit union, shrinking the data center cut out about 33 power ports and two circuits, Gonzales says. However, he adds, the organization doesn't have power measurement tools, so he can't quantify the energy and cost savings.

IT managers also need to pay attention to ongoing hardware density advancements, Sams adds. Using denser hardware, IT managers can shrink facility footprints and costs while keeping pace with rising workload demands.

"Technology is getting a lot smaller, [which] means

you can jam a lot more of it into a smaller space," he says. "A data center may find itself doing three times the computing for two times the energy."

Phil County, director of IT services at Victoria University in Melbourne, Australia, is another manager looking to benefit from a compact data center. County is overseeing construction of a data center complex that will be large enough to meet the university's extensive computing and networking needs yet small enough to generate savings in hardware, energy usage, real estate and other areas.

"Our objective is to have the data center as small as possible," he says. "Rather than having one of those big football-field-sized data centers that used to be around in the old days — and still are in

many places — we're creating a new kind of data center."

Victoria University operates 11 campuses and other sites in the greater Melbourne area, educating more than 45,000 students. The university views the new data center complex, located in two separate sites in the towns of Sunshine and Footscray, as critical to supplying educational services to its students and supporting administrative functions.

"We wanted to ensure that we plan for future growth, so we acquired a design and a solution that could meet our data center needs for at least the next 10 years — including increased power, cooling, space and floor load capacity," County says.

Although it will be operating the new data center in two locations, the university is creating a single logical facility that will offer redundancy and flexibility. The Sunshine facility will occupy 325 square feet, and the Footscray site will cover 650 square feet.

Virtualization, high-density racks and a modular design will enable the university to minimize energy demands. The data center also will use in-row cooling, targeted at the heat load source, and it will take advantage of Melbourne's chilly winter climate for free cooling.

Traditional cooling systems rely on electricity to drive compressors to reject heat and produce cold air, County says. The Victoria University cooling system has that capability, but it also will use ambient air within certain temperature ranges to reject heat and provide cooling.

"At [15 degrees Celsius] this process begins to work, providing free cooling, and

PHIL COUNTY, DIRECTOR OF IT SERVICES, VICTORIA UNIVERSITY

at below 5 C the ambient air temperature does all of the work of the compressors, thus saving clients the use of the compressors to provide the cold air," County says. "The system is set up to ensure that these processes work without requiring human intervention — so whenever the ambient temperature reaches the threshold, the system kicks in."

County says the data center is expected to use 45% less power than one with a conventional design, potentially saving more than 300,000 kilowatts of energy per year.

As the new data center takes shape, it's bringing together servers and other equipment previously scattered across Melbourne in various university buildings. "We've already centralized over 350 machines and reduced the number of boxes to about 240," County says.

VIVA VIRTUALIZATION

Virtualization is a must-have for reducing data center size and accompanying costs, says Peter Castaldi, co-founder and principal of Kovarus Inc., a South San Francisco-based firm that specializes in data center design. "If you take 100 servers and reduce them down to 10, that's 90 servers that you no longer have to pay an annual support fee on — servers you no longer have to pay electricity for 24 hours a day, seven days a week, 365 days a year, regardless of whether they're 10% or 100% utilized," he says.

Environmental costs also will collapse, he notes. "That's 90 servers you no longer need to pump cold air into to keep them from burning up," Castaldi says. On the other hand, IT managers shouldn't assume there will be a direct 90%

reduction in energy costs, since the remaining 10 servers could very well have larger workloads, he adds.

While virtualizing servers is perhaps the best method of lowering hardware overhead, managers intent on slashing the size of their data centers also need to look for other technologies to virtualize. "Think [beyond] server virtualization — it's about virtualizing your entire data center," Castaldi says. "There's storage virtualization, desktop virtualization and virtual lab automation."

The biggest challenge in data center downsizing is planning, Gonzales says. "You really have to be careful in designing everything so that every last piece fits," he says. "You certainly don't have space to waste."

While some observers might expect IT managers — and their staffs — to resist being forced into a shrunken professional domain, Gonzales says that a smaller data center doesn't reflect on his skills as an administrator or the work his team performs. "We're judged on how well we do our job, not on how much area we consume," he says.

Although data center downsizing can lower many costs, Castaldi notes that enterprises need to be realistic in their expectations. Some data center costs — such as those associated with the size of the IT staff — aren't affected by the facility's size.

"We don't necessarily see companies reducing IT staffing levels," Castaldi says. "Instead, their IT staff can work more intelligently, and [managers] can get more bang for their buck out of them." ■

GoToAssist®

by **CITRIX**

DECADES AGO, Dr. Victor E. Pollak came to an important realization: For all the good they do, doctors fail miserably when it comes to organization. They keep inefficient, inadequate medical records that fail to show a patient's long-term history.

Consider how traditional records for a typical diabetic patient are arranged. The patient's blood sugar results are in one place, his latest insulin prescription is in another, and the nurses' notes are somewhere else.

"I came to the conclusion that I was unable to care for my patients, I was unable to teach medical students, and I was unable to do research on my patients. And I decided

Dr. Victor E. Pollak accepts the Computerworld Honors award on behalf of MIQS.

than Lorch, director of medical informatics at The Rogosin Institute, a treatment and research institution for kidney disease in New York.

Lorch, a nephrologist, started using Disease Manager Plus nearly 15 years ago while at a different New York clinic. "I wanted something that wasn't just a repository of data but rather something that would help us care for patients," he says, noting that dialysis patients experience a range of medical problems that must be managed.

Disease Manager Plus essentially provides a reporting engine to deliver better insight into patient care management, a function that Lorch sees as a key innovation. Thanks to the way

UP-TO-THE-MINUTE MEDICINE

that the problem was with the medical records and that a new medical record was needed to solve those problems," says Pollak, a leader in the field of nephrology, which involves the diagnosis and treatment of kidney diseases.

That revelation came in the mid-1960s, prompting Pollak to start building a new way of keeping records on his patients' treatments, prognoses and progress.

Pollak's frustration and subsequent innovation eventually led to the creation of MIQS Inc. and its Disease Manager Plus software package, which delivers a new type of medical record for the care of patients with chronic diseases. The software brings together in real time all the formerly separate data points on each patient or patient group and presents them according to each doc-

The real-time reporting engine in Disease Manager Plus helps doctors manage care for patients with chronic illnesses. **By Mary K. Pratt**

tor's individual preference.

"All the information about a patient needs to be accessible equally. Our major asset is how we organize the data on the back end. It gives the doctors what they want to see at the point of care in the way they want to see it," says MIQS President and CEO George F. Rovigno. "And we have pretty persuasive data that if you get the data at the bedside, the

patient will do better."

MIQS, which primarily markets Disease Manager Plus for the care of dialysis patients and patients with kidney disease, was named a 2009 Computerworld Honors Program honoree for its work on the software. And Disease Manager Plus itself has earned significant praise from medical professionals.

"There's nothing that comes close," says Dr. Jona-

the data elements are stored, he says he can pull together data to look at trends over time. Lorch calls it a time- and life-saving function.

The results of a study that Lorch and Pollak conducted in November 2007 back up that assertion. In the peer-reviewed journal *BMC Medical Informatics and Decision Making*, the physicians reported that they tracked how using Disease Manager Plus affected patient outcomes and found that mortality decreased by 48% in one unit after just two years of using the system. Moreover, they found that the mortality rate in the clinic's units were 35% to 40% lower than the national mortality rates reported by the U.S. Renal Data System. In addition, they reported that thanks to the system, clinical staffing was 25% lower per 100 patients

Picking Doctors' Brains

AT A GLANCE

■ **MIQS Inc.** in Boulder, Colo., makes **Disease Manager Plus**. A medical records software system for clinical and administrative use, **Disease Manager Plus** is designed to help caregivers manage patients with chronic diseases—particularly those undergoing dialysis. **MIQS** wouldn't disclose its annual revenues but says its software has had a role in the care of approximately 150,000 patients by more than 5,000 users over nearly 20 years.

■ **Project champions** include **John P. Flynn**, vice president of engineering and co-founder; **Dr. Victor E. Pollak**, senior vice president, medical director and founder; and **George F. Rovegno**, president and CEO.

■ **MIQS** has five IT staff members, including **Flynn**. Four are programmers working on **Disease Manager Plus**, while the fifth provides IT support for customers and the company itself.

■ **Disease Manager Plus** users see a financial return on investment as well as better patient outcomes. **MIQS** officials say typical system costs are \$35 to \$75 per patient per month, while revenue improvements run \$125 to \$250 per patient per month. The best benchmarked performance was more than \$1,500 in revenue improvement per patient per month.

than the national average.

Eric Brown, an analyst at Forrester Research Inc., says that electronic health records, and specifically those systems that offer reporting capabilities, hold promise for controlling costs and improving care. However, he says only some hospitals and large physician groups are implementing systems that incorporate analytics.

"The sad reality is that there's still a minority of doctors and hospitals that have the data to begin with," Brown says. Some facilities still store patient information on paper; others might store it electronically, but different pieces are in different places, making it difficult or impossible to pull together all the pieces to analyze.

But Brown notes that there's a push to have the health care industry capture data electronically and adopt analytical software. "We've matured, and there are much more sophisticated and mature systems available. We're getting there," he says.

Although Pollak started to develop this type of medical record back in the 1960s, the foundation for **MIQS** dates to the 1980s, when he worked with programmers **John P. Flynn** and **Andy Flatt** at a dialysis center to develop an in-house electronic patient records system.

Those three were among the five founders of **MIQS**, which opened in 1990.

Flynn, now the company's vice president of engineering, says 1980s-era medical records software was built mainly to handle administrative functions, such as

the processing of insurance claims. Pollak, however, wanted software that focused on patient care and could pull together data for caregivers to see instantly, he says. **Disease Manager Plus**, which was first released in 1992, filled that need.

Flynn says the company opted to put its front-end software in a relational database, using **Sybase Inc.** products from the start. He says the company picked **Sybase** at the time because it was smaller than some other vendors and could give **MIQS** more personal service and technical support while providing the sophistication it needed.

Flynn says input from Pollak and the caregivers using the application was critical to the design of the software and is still crucial to its evolution. **MIQS** makes 500 to 800

enhancements to the system every year, **Rovegno** says, building on suggestions and requirements from the caregivers who use it. Company officials say R&D costs have run between \$12 million and \$16 million annually.

Flynn says **MIQS** has taken advantage of new technologies, particularly wireless networks and handheld devices, to help increase the mobility of caregivers.

He says he'd like to add more support for handheld devices. And while the product has a number of security features to ensure HIPAA compliance, **Flynn** also says he'd like to add other authentication tools, such as fingerprint readers. ■

Picking Doctors' Brains

The programmers at MIQS don't have medical degrees, yet they're developing software for doctors and nurses who deliver highly complex medical care. The programmers, including co-founder Flynn, developed a product that works in a specialty, they haven't been trained in. But many IT workers who are called upon to build systems for businesses have one thing in common: They know how to ask.

So how did the MIQS IT staff, who are that challenge and build the award-winning **Disease Manager Plus**?

Dr. Victor Pollak, the company's senior vice president and medical director, credits a "cooperative, ongoing relationship between software engineers and the physicians."

"People have to talk to each other," he says, noting that both sides work at listening to and

understanding each other.

Pollak says that MIQS's "big advantage" is that it has a staff that understands the clinical side of the company. "We're not just talking to doctors," he says. "We're talking to the doctors' people." He says that's why he hired IT staff that had a background in medicine. "I hired IT people that were doctors' people," he says.

Flynn says that an environment that values solving problems and not just fixing them is critical to success.

Trouble Ticket

AT ISSUE: Most users have disabled timed screen lockouts.

ACTION PLAN: Take away the option of disabling the lockouts.

Better Security For Not Quite All

A new policy preventing users from opting out of **password-protected screen locks** actually **reduces the level of protection** for some.

IT'S SCARY to think how much sensitive or even valuable information can be gleaned from an untended PC, even one whose user just walked away for a few minutes. That's the sort of thing that security managers fret about but the rest of the world hardly notices.

And it's one of the reasons I'm on the verge of deploying a group policy to enforce a password-protected screen lock on every device used to log into my company's domain. The high-profile impetus for this policy change was the laptop thefts that I wrote about a while back, but just as compelling for me is our move to an open workspace. Maybe security managers just see vulnerabilities wherever they look, but an open workspace looks like a security nightmare to me. I've already seen too many employees simply walk away from their workstations on the open floor, leaving their e-mail, work documents or personal information readily visible on their screens.

With this policy change, users will no longer be able to alter any settings related to the password-protected screen lock other than their choice of screen saver. We've decided to set the lockout at 15 minutes, which I know will increase the overall security posture of the company, because until now users have been able to turn off the lockout entirely — and several have done so. We know this because we recently did a query of the PCs attached to our domain, in order to ascertain how lockout was configured on them. We found that more than 70% of our approximately 6,000 users had disabled both the password requirement and the screen saver.

But that query presented me with a quandary. That's because we also found that some 1,500 users had

strengthened their lockout policies by decreasing the time limit to less than the 10 minutes that we had used as a baseline configuration. So the new policy will represent a more lenient security setting for those 1,500 people, who no longer will be able to choose a time of less than 15 minutes.

What concerns me is the message we will be sending to those employees. They have shown the sort of awareness of security issues that I try to instill in the entire workforce, and now we're rolling out a policy that seems to say that their security consciousness was unnecessary. We'll have to make sure that isn't the message they take away from this change.

AHEAD OF THE PACK

When I proposed the change in our lockout policy to the CIO, he asked me to determine what other companies in our industry are doing. I have a pretty decent network of peers in this industry, so I asked them whether they enforce a screen lock — and if so, what the timeout value is,

and if not, what their policy regarding screen locks is. I was surprised by the results: Only one of the 20 companies in my survey enforces the screen lock. That wasn't the response I had anticipated, and it certainly wasn't what I wanted to report to the CIO. In the end, though, he agreed with me that this is one area where it's worth bucking the industry norm.

So we are moving forward, although I have agreed to allow certain exceptions to the policy. Employees eligible for exemptions include developers and users who frequently do presentations or hold online meetings. Exceptions will be executed by placing those users into a separate Active Directory group that won't have the screen lock policy applied.

Meanwhile, my efforts to educate the staff will continue. I will follow up the policy deployment by putting up posters to remind users that even though their screens now lock after 15 minutes of inactivity, they should still manually lock their screens whenever they step away from their PCs. ■ This week's journal is written by a real security manager, "Mathias Thurman," whose name and employer have been disguised for obvious reasons. Contact him at mathias_thurman@yahoo.com.

■ **Over 70% of users had disabled both the password requirement and the screen saver.**

Finally, a server room solution for people without a server room.

Introducing self-contained, integrated "cooled enclosure" solutions now available for non-IT spaces.

Need more IT room but don't have the floor space or budget? No problem.

APC introduces NetShelter CX Office, the integrated rack enclosure designed to keep IT equipment cool, quiet, and secure while blending seamlessly into any office environment. Housed in an attractive wood veneer cabinet, NetShelter CX Office combines the technology IT managers demand with the style decorators appreciate. Now you can deploy servers and networking equipment right in the workspace – no need for a dedicated computer room.

A rack enclosure so quiet, you won't know it's there

The soundproof construction allows you to place the NetShelter CX Office anywhere without disrupting day-to-day office activity. The ultra-quiet air cooling system and advanced sound-dampening features reduce server noise by more than 98 percent – lowering it to the same unnoticeable background hum of building air conditioning.

Integrated, all-inclusive plug-and-play solution

Fully portable, completely pre-assembled, and carefully pre-tested, the NetShelter Office gives you integrated power distribution, cable management, and high thermal capacity in a standard size rack enclosure. Add the award-winning APC Smart-UPS and environmental monitoring and management software and you have a complete IT package. All you need to do is decide where to put it.

Learn how to reduce cooling expenses with our FREE Cooling Efficiency kit.

Visit www.apc.com/promo Key Code n137w • Call 888-286-APCC x5249 • Fax 401-786-2797

Available in three sizes:
18U, 24U, and 38U

Expand your server room space without building out.

The unique NetShelter Office CX enclosure solution includes everything you need to house a highly reliable IT deployment anywhere you have empty space.

- Available in three convenient sizes: 18U, 24U, and 38U.
- Supports nearly every major server series.
- Zero U power distribution unit – no need for additional rack-mount PDU.
- Soundproof cooling handles up to 3.6kW thermal capacity.
- Removable side panels for easier maintenance and installation.
- Locking doors for security.

Do Org Charts Still Matter?

BEFORE THE financial meltdown, were the organizational charts of Lehman Brothers and Bear Stearns (both now extinct) noticeably different from the organizational arrangements at Goldman Sachs (whose brand and revenue are now ascendant)? Not really.

The fact that similar organizational charts can lead to fundamentally different business outcomes prompts one to ask whether org charts still matter. Do they convey the information we need?

Org charts are maps, of sorts. There is a passage in Shelby Foote's masterful history of the Civil War describing Robert E. Lee poring over a map of the Virginia countryside in preparation for the battle at Chancellorsville in 1863. Lee, according to Foote's account, "kept peering at a map spread on his knees; he peered so intently, indeed, that he seemed to be trying to make it give him information which it did not contain." That, unfortunately, describes too many of today's business leaders bent over their org charts. They are trying to make those "maps" give them information that they do not contain.

But org charts can be de-

vised that contain far more relevant information. The org chart was invented not long before Lee camped at Chancellorsville, to help the trains run on time. The world has changed much since the early days of the industrial revolution. The organizational charts of most corporations have not. Thus, it's not surprising that key elements of 21st-century value creation are not depicted on most org charts.

At an abstract level, organizations can be conceptualized as amalgams of responsibilities and accountabilities (what specific people are supposed to do); knowledge (what people know); process

(how things get done); interactions (the combination of people, knowledge and process); and futures (what comes next).

Traditional org charts depict only the first element of organizational design — responsibility and accountability. Think what you could do with one that depicted some of those other elements.

Take interactions and knowledge, for example. Corporate anthropologist Karen Stephenson, a frequent contributor to research being conducted at the IT Leadership Academy in Jacksonville, Fla., has rightly been recognized as a pioneer in the science and practice of social networking. Among her accomplishments, she has developed complex mathematical algorithms to assist in our understanding of the interactions that are critical to value creation.

This means it's possible to devise mathematically

derived social network maps in your enterprise. You can go beyond an org chart of the visible organization to a map of the more important, informal organization, which is really a complex web of interactions: face-to-face and device-to-device exchanges of data, information, knowledge, intent, aspiration and angst. Using the tools of social networking renders these interactions more understandable and more manageable.

And "how things get done" and "what comes next" are also not out of reach of organizational maps. Take as an example what's happening in the innovation department at McDonald's. Informed by senior management, the innovation team has created an "organizational/operational" spreadsheet that assembles a portfolio of possible futures. These futures, termed "restaurant concept cars" by observers, are carefully vetted by franchisees and rigorously stress-tested to make sure they will work in the real world.

Without a doubt, this puts the people who invented the quick-service restaurant industry ahead of the curve in how they think and prelive the future. How far ahead of you will you let them get? ■

Thornton A. May is a longtime industry observer, management consultant and commentator. You can contact him at thorntonamay@aol.com.

■ What if your org chart depicted interactions and knowledge, and not just the visible organization?

Career Watch

The Employment Outlook

Expect new hiring in the technology sector to be cautious for the rest of the year, says Robert Half Technology, whose IT Hiring Index and Skills Report for the fourth quarter shows that 61% of CIOs surveyed expect to expand their IT teams, while 61% are planning staff reductions. RHT calls that a wash, though there's nothing to suggest that those hiring and those laying off will do so at the same rate. Here are some other find-

ings from the survey

- The best region for getting hired might be New England, where 81% of managers expect to expand staffs, while only 41% anticipate staff reductions.

- Companies with 1,000 or more employees will be the most likely to hire new staff, with 11% of managers at such companies saying they plan to do some hiring, compared with 7% who expect to let staff go. At the same time, a study by Forrester Research Inc. concludes that midsize businesses offer more stable employment for tech workers, with fewer layoffs. The two studies aren't contradictory; it could be that large companies have to do more hiring now to make up for their larger layoffs earlier.

- Network administration is the skill most in demand, cited by 69% of the respondents.

CANCELED OUT

- = CIOs expecting to hire
- = CIOs expecting layoffs

Hiring expectations remain well below last year's levels, while layoff expectations remain much higher.

Marketing You

Resumes still matter, because they are the best way for job hunters to present a quick synopsis of their skills — to make a compelling argument for why they are the best choice for the job. But just taping all your degrees and accomplishments on an 8 1/2-by-11-inch sheet of paper and adding your contact information isn't enough. Design matters, because you want your skills and experience to leap out at hiring managers.

One group that takes resumes very seriously is Career Directors International. It hosts an annual competition among professional resume designers, and it also makes some resume professionals available at career fairs to provide brief critiques of people's

resumes (Go to NationalCareerFairs.com to find out when a fair will be held near you.)

You might also keep an eye on the CareerDirectors.com site to see whether winners of this year's resume competition — which was held on Oct. 17 — have been posted, as they have been in years past.

One intriguing approach that was used by the winner of last year's contest seems especially adaptable for IT workers. Sharon Williams of JobRock.com used an eye-catching chart in a resume for a sales manager. The chart illustrated retention rates for clients of a weight-loss clinic, but it could just as easily have shown network availability under your stewardship or a decline in data breaches since you took over security at your company.

Paul M. Ingevaldson

IT Is Not the Mailroom

IN 1989, Peter Drucker penned a famous article for *The Wall Street Journal* titled "Sell the Mailroom." In it, he made the case for shedding those elements of your business that "do not make a direct and measurable contribution to the bottom line." These he listed as "clerical, maintenance and support work." Drucker argued that such

departments would have a much better chance of improving their productivity if they were part of an organization whose job it was to do that kind of work. If those departments stayed in-house, he wrote, the people working in them would have "little incentive to improve their productivity."

Somewhere along the way, senior management — always intrigued by ways to reduce expenses — determined that since IT was a support department, it was a perfect candidate for outsourcing.

What they missed is that IT supports the very heart and soul of the company. If the cafeteria doesn't open on time, or the maintenance crew fails to show up, or the outside attorneys lose a case, the company still goes on. But let IT systems — hardware or software — be compromised, and the business could shut down. I guess

I would call IT the uber-support department.

But look at what is happening in many of our IT shops. CEOs are challenging CIOs to look into outsourcing as a way of saving money in these tight financial times. Outsourcers prepare enticing proposals filled with promises of cost savings that most senior executives would have a hard time walking away from. And when a proposal is accepted, the company usually ends up transferring some or all of its IT people to the outsourcer. Drucker's old pitch is delivered again, and the executives are told that the people in IT will have a better chance of advancement when they are

working for a technology company. But what no one seems to realize in time is that this is another way of saying that the best people will now be employees of someone else and at some time will be transferred off of your account.

If, down the road, something happens, who is going to know how to fix it? If we want to know how something works in the system, whom are we going to ask?

By outsourcing, we are losing some of our best talent, the people who understand how our systems work — and therefore how the company works. Their knowledge is so deep that it's not a stretch to think that among them could be the people who might lead the company in the future. But they're gone now, turned into someone else's assets.

Of course, there have been many well-known examples of outsourcing nightmares, both in

the private sector and in government. Oftentimes, these disasters are precipitated by communication problems, difficulties in managing people working in widely disparate time zones, and the loss of face-to-face discussions.

There are also many examples of companies that decide to drop their outsourcing relationships and reabsorb the work back in-house. In trying to make a bad decision right again, these companies face daunting costs and problems as they try to rebuild their IT infrastructures in a short time.

As the economy begins to emerge from recession, my prediction is that the underperformers will include a disproportionate number of companies that decided the lean times called for the drastic measure of outsourcing IT. In the past, postrecession periods have led to strong demands for IT systems that could enable companies to take advantage of growing markets and increased access to capital. The companies that have active and thriving IT departments will definitely hold a competitive edge.

Of course, that assumes that the outsourced cafeteria opens on schedule and the IT people get their coffee! ■

Paul M. Ingevaldson retired as CIO of Ace Hardware in 2004 after 40 years in the IT business. You can contact him at ingepei@aol.com or visit his Web site, www.paulingevaldson.com.
